Electronics and Communication Department
Sri Sivasubramiya Nadar College of Engineering, 603110

1. From the constellation plot shown in figure below, answer the following questions?

Figure 1: Constellation plot which is to be identified

1. What type of modulation does this represent?

The modulation is 8-PSK

2. How many symbols (M) are represented?

8 symbols

3. How many bits per symbol (N) are used?

3 bits

4. What's the bit rate when baud rate is 10,000 symbols/second?

30,000 bits/second (30kbps)

5. Compare the noise performance of this modulation with 16-QAM, which is better?

8-PSK should in general be less susceptible to noise because the symbols would be spread further apart. Approximately, the minimum distance for constellation points for 8-PSK is $1.325\sqrt{E_b}$ which is slightly greater than for 16-QAM which is $1.265\sqrt{E_b}$.

6. Compare the spectral efficiency of this modulation with QPSK, which is better?

8-PSK has better spectral efficiency since it uses $2R_b/3$ bandwidth which is less than the bandwidth R_b used by QPSK

2. Solve the IQ demodulator equation showing how I and Q components are received back.

Composite Input signal:

$$X(t) = I * \cos(2\pi f_c t) - Q * \sin(2\pi f_c t)$$

Inphase Component (multiplied with LO signal):

$$\begin{aligned} X_i(t) &= (I * \cos(2\pi f_c t) - Q * \sin(2\pi f_c t)) * \cos(2\pi f_c t) \\ &= \frac{I}{2} + \frac{I}{2} * \cos(2\pi f_c t) - \frac{Q}{2} * \sin(2\pi f_c t) \end{aligned}$$

Quadrature Component (multiplied with $\pi/2$ shifted LO signal):

$$\begin{aligned} X_q(t) &= (I * \cos(2\pi f_c t) - Q * \sin(2\pi f_c t)) * -\sin(2\pi f_c t) \\ &= \frac{Q}{2} - \frac{Q}{2} * \cos(2\pi f_c t) - \frac{I}{2} * \sin(2\pi f_c t) \end{aligned}$$

After LPF (sin,cos terms with f_c are cancelled):

$$\begin{aligned} X_i(t) &= \frac{I}{2} \\ X_q(t) &= \frac{Q}{2} \end{aligned}$$

3. Calculate maximum theoretical spectral efficiency for:

1. $\pi/4$ QPSK:

Maximum theoretical spectral efficiency = 2 bits/s/Hz.

2. 256-QAM:

Maximum theoretical spectral efficiency = 8 bits/s/Hz.

4. Create a transmitter and receiver architecture.

Use the following parameters:

Input bit rate 1 Mbps

Modulation method: QPSK or 16-QAM

RRC roll-off factor 0.2

RRC output samples per symbol: 8

Carrier frequency 2.5MHz

Use AWGN channel with SNR = 10dB

Equivalent settings in receiver side

```

1  % passband_modulation.m
2  close all;
3  bitrate = 1e06;
4  Fc = 2.5e06;
5  Fs = 8 * bitrate;
6
7  M = 4; % Modulation order
8  k = log2(M); % Bits/symbol
9  n = 500; % Transmitted bits
10 sps = 8; % Samples per symbol
11 EbNo = 10; % Eb/No (dB)
